

AZBDC20A20

Description

The AZBDC20A20 PWM servo drive is designed to drive brushless DC motors at a high switching frequency. To increase system reliability and to reduce cabling costs, the drive is designed for direct integration into your PCB. The AZBDC20A20 is fully protected against over-voltage, under-voltage, overcurrent, over-heating and short-circuits. A single digital output indicates operating status. The drive interfaces with digital controllers that have digital PWM output. The PWM IN duty cycle determines the output current and DIR input determines the direction of rotation. This servo drive requires only a single unregulated isolated DC power supply, and is fully RoHS (Reduction of Hazardous Substances) compliant.

Notes

1. Maximum duration of peak current is ~2 seconds.

2. Lower inductance is acceptable for bus voltages well below maximum. Use external inductance to meet requirements.

3. Requires a 100µF/200V electrolytic capacitor near the P2 Power Connector between High Voltage and Power Ground pins.

4. Additional cooling and/or heatsink may be required to achieve rated performance.
