With new helical-worm gear units the tooth flanks are not completely smoothed down. The efficiency is lower than after the running in process. For a two start worm the decrease is about 6%. The running-in process is essentially concluded after 24 hours. The rated efficiencies are achieved if:
- the gear unit has been run in completely,
- the gear unit has reached the nominal operating temperature,
- the recommended lubribant is used,
- the gear unit is working with rated load.

The selection table contains standard geared motors with
- Three phase motor DM/DA, 4 pole, Pn=0.12..45kW
- Ratio of gear unit i<500
- Gear coefficient cG<2.5 (DM63..DM80 cG<2.0)

Additional geared motors can be combined with help of corresponding selection table for gearboxes.

Efficiency of gearbox

The efficiency of the gear unit for helical gear units G, shaft mounted helical gear units F and helical bevel gear units K depends on the number of gear stages, 2-stage (0.96) and 3-stage (0.94).
The efficiency of helical worm gear units S depends on the ratio of the worm gear stage, the input speed into the gear unit and the temperature of the gear unit.
The efficiency of helical worm gear units S is shown in the selection table for gear units.
The efficiency of helical worm gear units S for back driving is significantly lower than the normal efficiency. In certain cases the worm gear unit can be self-locking.
At certain mounting positions the gearbox is completely filled with lubricant. At high input speed mixing losses can reduce the efficiency of the gear unit.

Drive selection

Selection conditions

The following conditions must be considered in the selection of the geared motor:

	T2	[Nm]	Torque of geared motor (see selection table)
T2 ≥ TA	TA	[Nm]	Counter-torque of driven machine
cG ≥ fB	cG		Gear coefficient (see selection table)
	fB		Application factor of driven machine

Further, the selection of the gearmotor is influenced by the following factors:

- Duty cycle of the motor
- Application of forces on the output shaft
- Ambient temperature and altitude
- Environment conditions

Please consult the manufacturer in the case of complicated drive applications.

Application factor fB

The service factor of the driven machine is given from the shock grade, the average operating time / day and the number of switches per hour. The shock grade is given from the mass accelleration factor of the driven machine.

$$FJ = \frac{Jred}{Jmot}$$

FJ	Mass acceleration factor
Jred	All external inertias corrected to motor input
Jmot	Inertia (Motor)

Shock grade	FJ	Operating time hours/day	Operations per hour			
			< 10	10 ... 100	100 ... 200	> 200

Radial force on gear output shaft

$$F_R = \frac{M_{ab} \cdot 2000}{d_0} \cdot f_z$$

Transmission element	fz	Remarks
Gears	1.1	< 17 teeth
Sprockets	1.4	< 13 teeth

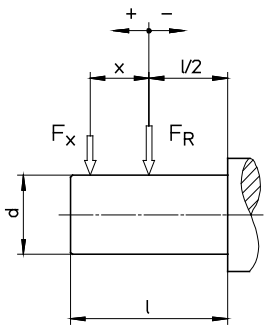
The radial force determined must not exceed the permissible radial force for the gear unit.

Permissible Radial Forces for the Output Shaft

If there are radial loads on the output shaft, they should be compared with the permissible values for radial forces.
The values in the table for the permissible radial forces apply under the following conditions
gear unit with solid output shaft, normal shaft ends
constant load in continuous operation
radial load on the middle of the output shaft in the case of worst load direction
- no axial forces



If the radial force is not applied to the middle of the shaft, use the following formula for the conversion of the permissible radial force:

$$F_{Rx1} = F_{R1} \cdot \frac{1}{1 + \frac{x}{K_1}}$$

$$F_{Rx2} = F_{R2} \cdot \frac{1}{1 + \frac{x}{K_2}}$$

$$F_{Rxp} = \min(F_{Rx1}, F_{Rx2})$$

F_{R1}	[N]	permissible radial force for bearing lifetime application at middle of output shaft (table)
F_{R2}	[N]	permissible radial force for shaft strength application at middle of output shaft (table)
K1, K2	[mm]	Constant (table)
x	[mm]	Distance (subject to sign, see sketch)
F_{Rx1}	[N]	permissible radial force for bearing lifetime application at point x
F_{Rx2}	[N]	permissible radial force for shaft strength application at point x
F_{Rxp}	[N]	total value of permissible radial force application at point x

The radial force determined from the application must not exceed the permissible radial force for the gear unit.
In certain conditions, the gear unit is able to accept higher radial forces.
If no radial force is applied, the permissible axial force for the gear unit is 50% of the calculated permissible radial force.
If the radial forces found for a special drive application are higher than the values in the table, or if radial and axial forces are acting at the same time, consultation with the manufacturer is necessary.

Motor Power Pn

The values given in the tables are valid for the following conditions:

- Duty cycle S1
- Maximum ambient temperature +40°C
- Installation altitude up to 1000m above mean sea level

The available motor power for different conditions is calculated as follows: $P = Pn \cdot fs \cdot ft \cdot fh$

Factor fs for different duty type

Duty type		fs
S1	Continuous duty. Operation with constant load. The motor reaches the thermal equilibrium.	1.0
S2-10min	Short term duty. Operation with constant load followed by a stop. During the stop the motor returns to the ambient temperature. Described by the duration of the load period in min.	1.4
S2-30min		1.25
S2-60min		1.1
S3-15%	Intermittent periodic duty. Operation with a sequence of identical cycles including a time of operation with constant load and a stop. Described by the cyclic duration factor in %.	1.4
S3-25%		1.3
S3-40%		1.2
S3-60%		1.1
S4 .. S10	Intermittent periodic duty. The start or stop phase of the motor is effecting the temperature raise. More data of the duty cycle are necessary.	On request

Factor ft for different ambient temperature θ		**Factor fh for different altitude h**			
θ ≤40°C	ft=1.0	h≤ 1000m	fh=1.0

Motor options

B - Brake COMBISTOP

- spring-set twin-disc safety brake
- Protection standard: IP54
- connection via contacts in terminal box
- adjustment provision for wear of friction linings without dismantling
- torque reduction possible
- Standard voltages: 230VAC, 400VAC, 24VDC

Mode of Operation

The brake is released by direct-current excitation of the brake coil (2) or by a manual release unit MB (3) which can be attached as an option. Braking is achieved in power off condition by means of spring force (1). The adjusting screws (5) are used to adjust the nominal air gap (X) in case of wear.

Electrical Connection

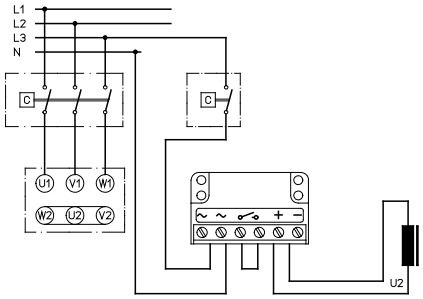

Figure 1: AC side switching

- The brake is switched independent from the motor voltage, Engagement delay time t11~
- Suitable for operation with frequency inverter

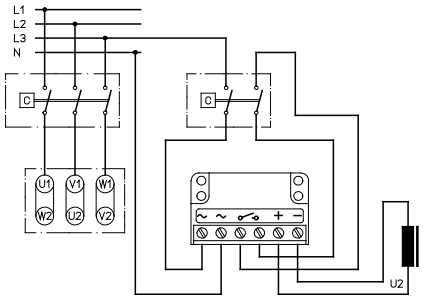

Figure 2: DC side switching

- The switching of the brake on AC and DC side leads to faster Engagement delay times t11=.

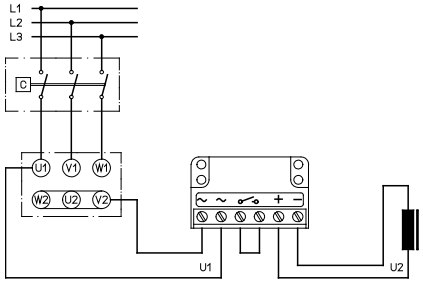

Figure 3: Brake ready for connection

- Voltage supply from motor terminal board.
- The brake is switched together with the motor voltage, Engagement delay time t11~
- In comparison to Figure 1 the connection to the brake is made within the motor terminal box
- Not suitable for frequency inverter operation and for pole changing motors
