Whatever type of clutch, brake or coupling your application requires, you can be most assured of finding it quickly and easily among the comprehensive assortment of such components available from PIC Design...one that includes a complete selection of electro-magnetic clutches and brakes and mechanical slip clutches and couplings.

PIC Design Clutches, Brakes and Couplings— A Brief Overview

ELECTRIC CLUTCHES AND BRAKES

The PIC line comprises both shaft-mounted clutches and flange-mounted power-on and power-off brakes, all highly suited to situations in which an immediate response is required in either start or stop functions of driving mechanisms. The variety of voltages and bore sizes offered is aimed at giving designers and engineers especially easy access to precise components needed for such applications as copier drives, tape and film drives and packaging machines.

SERVO ELECTRIC CLUTCHES AND BRAKES

These units consist of miniature precision electro-magnetic clutches and brakes designed for use in

military/aerospace applications and precision servo mechanisms. Each is available with a servo mounting flange and with one or two output shafts.

SLIP CLUTCHES

These stainless steel mechanical clutches come precision-calibrated and spring-wrapped, and are designed to accommodate the mounting of input gears, sprockets or pulleys. Slip torque is stable and independent of velocity, regardless of rotational direction.

ROLLER CLUTCHES

The roller clutches are used to transmit torque between the shaft and housing in one direction and allows free overrun in the opposite direction. The clutches are generally used in applications requiring indexing, backstopping, or overrunning.

SLIP COUPLINGS

These devices not only serve as couplings for two colinear shafts, but also as a torque limiter. When the load exceeds the limit torque of a slip coupling, the two shafts will rotate relative to each other at the full limit torque.

COUPLINGS

The designs and styles listed below are suitable for a wide array of applications; for example, a design requiring the connection of two in-line shafts of equal or unequal diameters measured either in inches or millimeters.

Bellows Couplings

Zero Adjustable Couplings

Flexible Couplings

Miniature Oldham Couplings

Wafer Oldham Couplings

Universal Lateral Couplings

Multi-Jaw Couplings

Precision Universal Joint Couplings

Molded Universal Joint Couplings

Precision Sleeve Couplings

Flexible Zero Backlash Couplings

Spider Coupling

Assistance in determining which coupling best fills your particular requirements is provided in the technical section that follows.

TECHNICAL SECTION

Industrial Clutches and Brakes

Clutches in this category are utilized in applications involving a driving shaft which, when rotating, is able to engage or disengage a secondary shaft driven either by gears or a belt-and-pulley combination. Industrial brakes are intended for applications in which the primary mover is to be held at its stop position. A power-on brake will decelerate and provide inertia when power is supplied, requiring that power be transferred from motor to brake. A power-off brake is energized along with the motor itself, decelerating and retaining inertia when the power is shut off. The latter is geared to applications where power consumption and safety are of major concern.

PIC Design clutches and brakes can perform any of the following functions for a variety of applications similar to the ones listed below:

Functions	Applications
Remote Coupling	Copier Paper Drives
Instant Reversing	Computer Disc Drives
Speed Changing	Card Feeders
Torque Limiting	Collators
Rapid Cycling	Money Dispensers
Indexing	Teletype Machines
Jogging	X-Ray Table Drives
Tensioning	Blood Gas Analyzers
Cushioned Starts & Stops	Ticket Dispensers

BURNISHING

Burnishing is a wearing in or mating process used to ensure the highest possible output torques. It is accomplished by forcing the clutch or brake to slip rotationally when energized. Best results are obtained when the unit is energized at 30-40% of rated voltage and forced to slip for a period of 2-3 minutes at a low speed of 100-200 rpm. Units in applications involving high inertial loads and speed will usually become burnished in their normal operating mode. Whenever possible, it is desirable to perform the burnishing operation in the final location so the alignment of the burnished faces will not be disturbed.

CYCLE LIFE EXPECTANCY

The number of cycles a clutch or brake will produce before it ceases to function is largely dependent on the following factors: (1) duration of slip while accelerating or decelerating a given load, (2) ability of individual unit to dissipate heat generated at friction faces, (3) thickness of friction material (used to retard wear), (4) thickness of armature plate, (5) type of bearing system used in clutch, (6) environmental conditions contributing to bearing and friction face degradation (dust, lint, grit, toner, oil, etc.). Units that are required to accelerate or stop small inertial loads at low shaft speeds (under 500 rpm) will experience little slip before lock-in at time of engagement, hence minimal wear and extremely long life, commonly in the tens of millions of cycles (typical of copy machine applications). The bearing system is usually the life limiting factor in these applications. Units that are required to accelerate or stop loads with large inertia (such as punch press fly wheels) will experience a longer duration of slip before lock-in, resulting in faster wear and the shortened life. Friction face wear only occurs while the units are slipping differentially.

Couplings

COUPLING SELECTION GUIDE

Coupling Type	Angular Misalignment $> 5^\circ$	Angular Misalignment $< 5^\circ$	Lateral Misalignment $> .010"$	Whistand Shock Loads	Vibration Dampening	High Speeds	High Torque	High Ambient Temperature	Clean Room Environment	Stepper Motors	Reversing Drives	Maintenance Required	Vacuum Environment (No Lube)	Compressibility	Electrically Insulated

Bellows Couplings

The ideal solution where shafts are angularly and laterally misaligned. They feature a stainless steel hub pinned to a stainless steel bellows.

Zero Adjustable Couplings

Get the same characteristics as on the bellows type coupling, except these couplings have an adjustable hub for zeroing synchros and other similar devices.

Flexible Couplings

These will isolate vibration, absorb shock loads and electrically insulate. They feature a molded neoprene body connected to stainless steel hubs.

Miniature Oldham Couplings

A choice of center block of oil impregnated bronze or nylon (eliminates metal-to-metal contact from taking place) between the hubs. Use these couplings in high-torque applications.

Wafer Spring Couplings

The choice for your highest torque applications and where there is up to 8° of angular and .03 inches of lateral misalignment.

Universal Lateral Couplings

Not only will these couplings provide electrical insulation, but they can handle up to 10° angular and .05 inches of lateral misalignment.

Multi-Jaw Couplings

Interlocking teeth permit precision coupling/decoupling with limited transmission error between two stainless steel hubs.

Universal Joint Couplings

Working angles up to 30° are no problem when you use these coupling. Standard in either Stainless Steel or Delrin.

Precision Sleeve Couplings

Use them when coupling shafts of similar or dissimilar diameters. This allows you to couple inch to inch, millimeter to millimeter, and inch to millimeter shafts.

Flexible Zero Backlash Couplings

Work well in high accuracy systems. Stainless steel or aluminum one-piece construction with high torsional stiffness, constant velocity, and very low wind up.

Flexible K Couplings

An excellent choice for use in abrasive dust environments and where maximum flexibility is required. The hubs are zinc plated; the bodies are polyurethane.

Spider Couplings

These provide high torque transmission without backlash or vibration due to the use of a chemically resistant and electrical isolating elastomer insert.

Shaft Extensions

Used to add an additional inch of shaft length or facilitate a change from special to standard shaft diameter. — See Section 6.

Features:

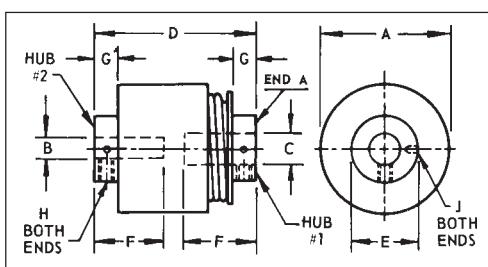

- A multi plate slip clutch
- Adjustable torque
- Preset torque available on special orders (Torque setting $\pm 10\%$)
- Can be used as a slip coupling
- Backlash of 6° is standard
- Constant tension
- Overload protection
- Controlled slip
- Clutches exhibit same torque in either direction
- Shaft to shaft clutch/ coupling or thru shaft to pulley, gear, etc.
- Bronze bearing in housing for thru-shaft to pulley models
- Low stick-slip ratio

Capacity at continuous duty, 50 RPM, 25 million cycles (Rev)

- *Note:
- For shaft to shaft coupling, set screws in both housing and cartridge — use Part No. ending with "S"
 - For thru shaft to housing (pulley, gear, etc.), bronze bearing in housing, set screw in cartridge — use Part No. ending with "H"
 - Metric bores can be accomplished by use of bore reducers (5,6,8 & 10 mm finished bores) found in the catalog
 - Consult factory for other bore sizes

SLIP COUPLINGS — CONTINUOUS SLIP OPERATION

$1/8"$, $3/16"$, and $1/4"$ Bores and 3, 4, 6 mm Bores

FEATURES

- Misalignment Allowance between shafts - 0.006"
- Stainless Steel
- Same or Different Torques Available for Two Directions of Rotation - See Special Ordering Information
- Torque Range: 1 to 120 Oz. In.
- Precise and stable limit Torque
- Same Torque at breakaway as at high slip velocity

Special Bores - $1/8$ to $1/2$
Higher Torques - To 240 Oz. In.
Larger Bores - To $1/2$ "
Available on Request

TO ORDER SPECIAL TORQUE SETTINGS:

Refer to Torque Range Min. — Max. values to obtain the practical Torque Ranges available for each basic coupling.

EXAMPLE: Special Slip Coupling:

T18-10 — 12 — 44

44 Oz. In. Torque Hub = 1, CCW Rotation Viewing End A

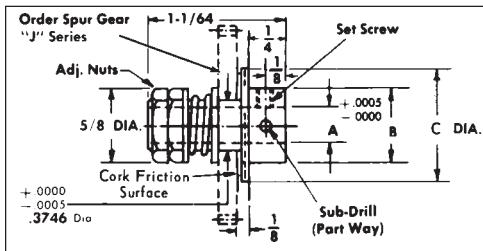

BASIC SLIP COUPLING

12 Oz. In. Torque Hub = 1, CW Rotation Viewing End A

SPECIFY: Basic Part Number — Required Torque for Hub #1. Rotating CW — Required Torque for Hub #1. Rotating CCW.

SLIP CLUTCH ASSEMBLY — ADJUSTABLE-MOMENTARY OVERLOAD*

Pin Hub ■ $\frac{1}{8}$ ", $\frac{3}{16}$ ", and $\frac{1}{4}$ " Bores and 3, 4, 6 mm Bores

Part No.	Friction Surface	Part No.	Friction Surface
MCH3-2, -4, -6	Pads	R3-3	Pads
MCH3-1, -3, -5	Ring	R3-10, 11, 12	Ring
ADJUSTABLE TO 10 OZ. IN. TORQUE FOR 10 TO 50 OZ. IN. TORQUE AVAILABLE WITH 0.07 TO 0.35 N-m ADD 50 TO CAT. NO. ON REQUEST			

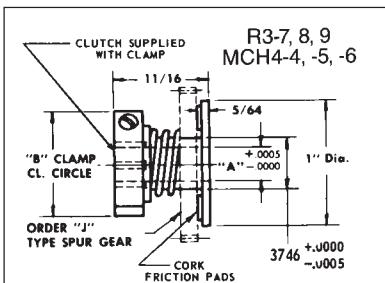

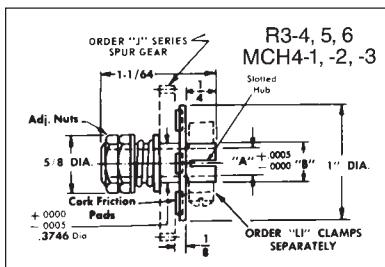

*Not to be used for continuous slippage. For continuous Duty Slip Clutch See T17, MCH2 Series.

Material: Stainless Steel

Material:

**Roller Cup - Case Hardened Steel
Needle Bearing - 52100 Hardened
Chrome Steel**

Cage: Acetal with Integral leaf springs

- Ideal for indexing, backstopping or overrunning operations
 - Free rolling one way, drives in opposite direction
 - Light weight, low profile
 - High indexing, frequency
 - Temperature max 200°F
 - Maximum Backlash
 - Shaft should be RC58 min. with 16u" finish or better

BACKLASH FREE ELASTOMER JAW “SPIDER” COUPLING

1/8" to 1/2" Diameter Bores and 4mm to 12mm Bores

Features:

- For electrical isolation and chemical resistance
 - Coupling with Integral radial clamp using socket head cap screws
 - High torsional stiffness:
 - Static 4.5 Lbf-Ft/deg (700Nm/rad)
 - Dynamic 9 Lbf-Ft/deg (350Nm/rad)
 - Misalignment Tolerances:
 - Angular 0.8°
 - Lateral .002" (.06 mm)
 - Axial ± .039" (1 mm)
 - Temp. Range (due to elastomer)
22° to 248°F (-30° to 120°C)

UNIVERSAL LATERAL COUPLINGS

1/8", 3/8", and 1/4" Bores and 3, 4, 6 mm Bores

Features

- Simultaneous lateral and angular misalignment
- Corrosion resistant
- Electrically insulated
- Light weight and space saving
- No lubrication required
- Separable

Specifications

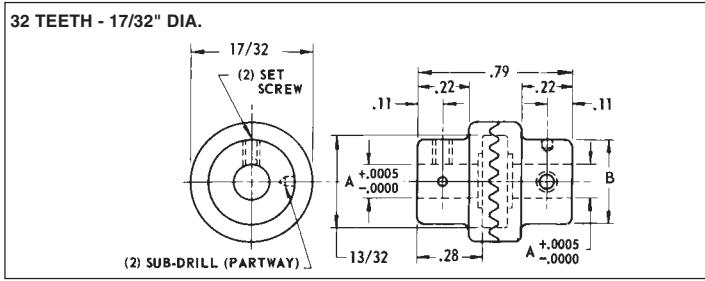

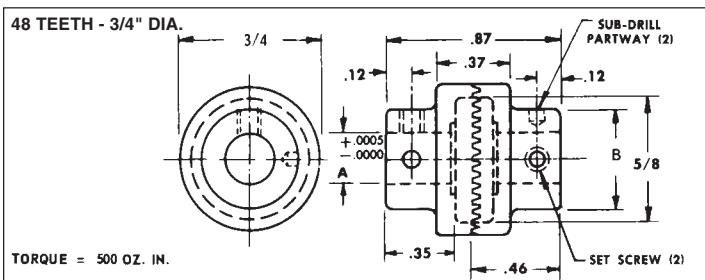

- Maximum angular misalignment: 10°
Maximum lateral misalignment: .050 inches
Maximum working torque: 15 lb. in.
Backlash: Negligible
Weight (1/2" bore): .5 ounces
Trunnion material: Nickel plated metal
Annular ring material: Delrin
Standard connection to shaft: Socket head cup point set screw

FLEXIBLE-ZERO BACKLASH COUPLING

1/8" to 5/8" Diameter Bores and 4 mm to 12 mm Bores

This Flexible-Zero Backlash Coupling is designed for applications such as drive systems for lead screws, gear boxes, high performance motion control systems for greater system accuracy and reliability.

- Coupling with integral clamp
- High torsional stiffness
- Low radial losses
- One piece construction
- Constant velocity
- Dynamic torque ratings are momentary values. For non-reversing applications divide by 2, divide by 4 for reversing applications.

Material: 7075-T6 Aluminum, Clear Anodize
or
17-4 PH Stainless Steel

2. T22A-XX denotes aluminum. T22S-XX denotes stainless steel.

(K) FLEXIBLE COUPLINGS

ILLUSTRATION 1

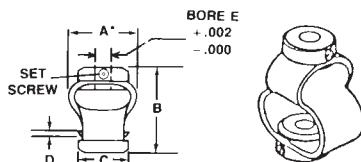

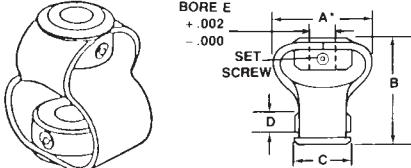

ILLUSTRATION 2

Material: Hubs — Zinc Plated Steel
Body — Polyurethane

FEATURES

Hub:

- Zinc plating resists corrosion
- Inside hub reduces overall length
- Rounded corners prevent cutting
- Annealed steel for maximum strength
- Precision swaged mechanical crimp
- Standard size set screws
- AGMA Class 2 bore tolerance: $-.000 + .002$

Flexible Element:

- Maximum flexibility because of unique design
- Polyurethane is durable, flexible, cut-and-wear resistant
- Greater radius for added strength
- Full wrap-around design stays securely in hub
- Non-standard bore combinations available...inquire for price and availability

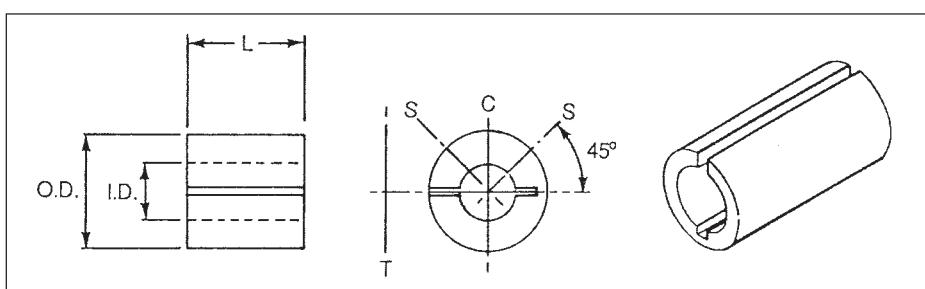

NOTE: Maximum operating speed is 3600 RPM.

BORE REDUCERS

Inch And Metric

Material: Aluminum

Inch to inch and inch to metric bore reducers adapt a coupling, clutch, pulley and other bores to a number of shaft diameters when fitted to a pin hub (set screw) or split hubs.

Grip relies on adequate contact area between the shaft and reducer.

Release of residual stresses after slitting may result in slight springing of the material, — this can be corrected by finger pressure.

For optimum fastening install bore reducers as shown:

"S" = Two Set Screw Position

"C" = One Set Screw

"T" = Tangential Screw In Clamp Hub

6	5.995	12.70	—	7.92	—	L1-6	MUJ3-3	MUJ4-3	

Universal joints will operate at angles up to 30° . For most efficient operation, operate at a maximum angle of 10° . Lubrication required.

Maximum speed: 300 RPM.

MOLDED UNIVERSAL JOINTS

$\frac{1}{8}$ ", $\frac{3}{16}$ ", and $\frac{1}{4}$ " Bores and 3, 4, 6 mm Bores

C	Capac. Oz-In.*		
In.	mm	Cont.	Manual
7/16	(11.11)	25	50
9/16	(14.29)	85	170

*Based on 3.6° max. allowable deflection for continuous operation and 7° for manual operation. Double joints have one-half of these capacities.

Max. shaft angles are 10° for 2000 rpm, 15° for 1500 rpm, 20° for 1000 rpm and 30° for 500 rpm.
